

# MUNICIPAL POPULATION PROJECTIONS

**2010 TO 2030**

Prepared by the NH Office of Energy & Planning (OEP)

January 2007

## **INTRODUCTION**

This is the third iteration of municipal projections since the 2000 US Census. Prior, 2000 census based, efforts were published in March 2003 and January 2005. The projections here use 2005 population estimates as a beginning point.

The municipal population projections contained in this report are controlled to county projections also developed by the Office of Energy and Planning. See the publication, *N.H. Population Projections for State and Counties, 2010 to 2030, Update: November 2006*. This publication explains the underlying assumptions of the projections, down to the county level. Controlling, respective municipalities to county totals strongly links the county assumptions to the municipal level projections here.

The projections should be viewed as baseline data. The OEP encourages the use of these projections as a point of departure for users to establish their own projections and/or for evaluating other projection efforts. This report attempts to present a set of future population levels which reflect past and emerging trends. Because they are controlled to county and state projections, these projections are considered to be reasonable in the aggregate as well as at the local level.

## **METHODOLOGY**

Any projection scheme is dependent on assumptions. This is true, regardless of the complexity or sophistication of the process employed. Basic assumptions include: that there will be no major war, civil strife or major natural catastrophe and that there will be adequate supplies of energy at reasonable prices.

The local projections are based on a community's historical share of its' respective county's growth. The principal assumption with this projection method is that trends of a community's population change, relative to the parent county will remain about the same in the future. However there are important limits and exceptions to this assumption. The basic trends in shares of county population change were established using 1960, 1970, 1980, 1990 and 2000 population totals. The municipal share of total county population was calculated for each of these years. Then a test was applied. Towns that gained or lost shares in all decades or since 1980 were typed, "consistent."

For consistent places, the numeric change in percent of county population was calculated. This change was applied to the 2010 county share<sup>1</sup>. This rendered a 2010 projected share for each community with "consistent" status. Thus the 2010 projected county shares are the result of trends established by the forty (since '60) or twenty (since '80) year trends.

However, for the 2015 county shares the rate of historic change is diminished by one third (33%). This 2015 county share was then held constant and used for the remaining three projection periods. The resulting sets of shares, for consistent places, are necessarily subject to further alteration. This is because shares for inconsistent places must be entered and then all shares must be forced to sum to 100% (of projected county totals).

Municipalities could be classified, "inconsistent" for one of two reasons. A municipality could have exhibited an inconsistent trend in the 1960 to 2000 period. Second, a municipality may have exhibited a consistent trend but, based on judgment supplied by OEP or a regional planning commission, were treated as inconsistent places. In most cases a regional planning commission supplied an updated rational for modifying the "consistent trend". In other cases it was obvious that the consistent trend was unreasonable to continue into the future. Some old population centers, consistently lost county share in the past. Had these declines been applied, unreasonably low populations would result.

## **INPUT FROM REGIONAL PLANNING COMMISSIONS**

Reasons for holding many of the communities from the established trend were provided by some of the state's nine regional planning commissions. The OEP solicited input from these agencies. The attempt was to combine the strengths of OEP and the planning commissions. The RPC's have greater in-depth knowledge of potential local population change, while OEP had already examined the most likely scenario for the state and its counties. Preliminary projections were sent to each RPC for review and comment.

Seven RPC responded. Most responding agencies provided guidance as to whether the OEP numbers were high or low. One gave detailed guidance for their large communities and where it was believed that the OEP numbers required significant changes.

Insofar as possible, all suggestions were included in these projections. It was not possible to adopt suggested numbers outright. This is because all local numbers were always subjected to the county controls. It was possible to reflect the structure of projections suggested by the regional planning commissions.

Finally, users of these projections are cautioned about placing unwarranted confidence in very small projected changes of population. Small changes, up or down, essentially mean that a community is expected to be "stable" for the involved time period. Small changes in population may simply be the result of controlling to county totals, or rounding to the nearest ten people.

---

<sup>1</sup> Actually only half of the change is applied because the historic trend is based on 10 years while the projected period is 5 years.
